ST. EDWARD SCHOOL
Faith Campus

SWOT ANALYSIS

PERFORMANCE TASK NO. 1

Work Immersion Program

Andrei B. Legaspi
St. Edward School Faith Campus – Grade 12 STEM Germany
St. Edward School – Research Team

April 9, 2026

I. INTRODUCTION

My work immersion program (WIP) was conducted at St. Edward School Faith Campus, where I was assigned as a member of the school's Research Team. In the absence of a formal and dedicated research space, our group made use of the Media Technology room as a makeshift research facility for the entire duration of the immersion. This arrangement, while unconventional, placed us at the center of an environment that required both academic discipline and a considerable degree of practical adaptability from everyone involved.

As a research team member, my primary responsibilities revolved around the systematic gathering, organization, and documentation of data relevant to the team's assigned research outputs. These responsibilities included conducting literature reviews, encoding and organizing research findings, drafting sections of formal research documents, and assisting in the preparation of presentations and reports. The nature of these tasks demanded not only accuracy and attention to detail, but also the capacity to work collaboratively and manage information responsibly under time constraints.

The Media Technology room, while resourceful in terms of the equipment it housed, was not originally designed for the kind of sustained and focused academic work that research requires. The space was limited in size, the furniture was not ergonomically suited for extended working sessions, and, most significantly, the internet connection was consistently unreliable. These conditions, rather than serving as mere inconveniences, became defining features of the immersion experience and shaped the way I and my workmates approached problem-solving and time management throughout the program.

The work I performed during this immersion is directly related to my target specialization in STEM, particularly in the field of scientific research and data analysis. Research competencies such as critical evaluation of sources, data management, technical writing, and collaborative inquiry are foundational skills in any STEM career. This immersion gave me an early and practical glimpse into how research is conducted outside of the classroom, reinforcing the value of precision, persistence, and intellectual rigor in professional scientific work.

II. SWOT ANALYSIS TABLE

Strengths (Internal)	Opportunities (External)
1. The Media Technology room was equipped with functional computers and audio-visual tools that directly supported the team's research documentation tasks. 2. The school setting provided a familiar and structured environment that eased the psychological transition from being a student to work immersion. 3. Faculty mentors and advisers were readily accessible within the campus, allowing for immediate feedback and continuous guidance on research outputs. 4. The collaborative dynamic among the research team members fostered shared learning, effective communication, and a clear division of responsibilities. 5. Exposure to an actual research workflow provided practical context to theoretical concepts previously encountered only in classroom instruction. 6. The program was supervised and organized, with defined deliverables that gave the team a clear sense of direction and measurable goals throughout the immersion.	1. The Media Technology room holds significant potential for development into a fully equipped and dedicated research facility, given the right institutional investment and planning. 2. Participation in a school-based research team provides early and meaningful exposure to the kind of systematic inquiry that is highly valued in STEM careers and university-level education. 3. The immersion experience serves as an initial foundation for building a research portfolio, which may strengthen future university applications and scholarship opportunities. 4. Working within the school's academic network created openings for collaboration with faculty on projects that are directly relevant to science, statistics, and STEM fields. 5. The challenge of adapting to an improvised and resource-limited setup cultivates the resourcefulness and flexibility that are consistently demanded in real-world research environments. 6. Being among the pioneering batches to conduct immersion in this setup positions the team to provide meaningful feedback that

	could raise the standards for future immersionists.
Weaknesses (Internal)	**Threats (External)**
1. The Wi-Fi connection within the Media Technology room was persistently unreliable, causing significant delays in online research, data retrieval, and the submission of digital outputs. 2. The room was not originally designed for sustained academic work, and the inadequate seating and desk arrangements resulted in physical discomfort over extended working hours. 3. The team had limited access to printed and physical reference materials within the room, making it necessary to rely heavily on digital resources that were difficult to retrieve consistently due to poor connectivity. 4. The absence of a formal and purpose-built research environment diminished the professional atmosphere that is conducive to serious and focused academic inquiry. 5. Proper ergonomic furniture was not available, which led to fatigue and physical strain after long periods of sitting and working on research outputs. 6. Ventilation and lighting in certain areas of the room were substandard, which negatively affected concentration and	1. Chronic internet instability posed a constant and direct threat to meeting research deadlines, particularly for tasks that were heavily dependent on real-time online access. 2. Prolonged exposure to physically uncomfortable working conditions carries a risk of negatively affecting the health, stamina, and long-term productivity of work immersion students. 3. As a shared and multipurpose facility, the Media Technology room is susceptible to scheduling conflicts with regular academic classes, which could unexpectedly disrupt immersion activities. 4. The improvised nature of the current setup, if left unaddressed and unchallenged, risks becoming an accepted standard that may place future immersion batches at a disadvantage. 5. The limited availability of on-site technical support means that equipment malfunctions or incidents of data loss may go unresolved for extended periods, jeopardizing ongoing research work. 6. The absence of a structured and properly resourced research environment may limit the

contributed to an uncomfortable working atmosphere. 7. There was no dedicated storage or filing system for research materials and documents, which occasionally resulted in disorganization and difficulty retrieving references. 8. The proximity of the room to common school areas exposed the team to frequent noise and foot traffic, which disrupted concentration during periods requiring focused academic work.	complexity, scope, and academic depth of the projects that student immersionists are able to produce. 7. Unforeseen external circumstances such as school-wide events, administrative changes, or emergency protocols could further restrict or eliminate access to the room without prior notice.

III. REFLECTION

Conducting a SWOT Analysis of my work immersion experience at St. Edward School's Research Team revealed far more than I initially anticipated. What the framework brought to light was a fundamental tension between potential and limitation, specifically a workspace that had the right people and the right intentions but lacked the physical and technical infrastructure to fully support the work being done. Seeing these factors laid out in a structured and analytical manner helped me understand that the challenges I encountered were not simply personal inconveniences, but genuine systemic conditions that shaped the quality and efficiency of our team's output. More importantly, it helped me recognize how I personally responded to those challenges and what that response reveals about my readiness for a career grounded in STEM research.

The strengths and opportunities I identified point clearly toward what I can build upon as I move forward in my academic and professional journey. The research skills I developed during this immersion, including documentation, data organization, technical writing, and collaborative inquiry, are directly transferable to university-level academic work and, eventually, to professional scientific practice. I intend to use these competencies as a foundation as I pursue higher education in STEM, particularly by continuing to develop my research writing and actively seeking out opportunities to participate in more formal research projects. The professional relationships I built with faculty mentors during the immersion are also something I plan to nurture, as networks within the scientific and academic community are established early and sustained over time. The opportunity the immersion provided to exercise initiative in an unstructured environment is one I consider especially significant, since scientific research frequently demands the ability to work through uncertainty and incomplete information with composure and critical judgment.

Addressing the weaknesses and threats I identified will require a combination of personal discipline and a proactive commitment to advocating for improved institutional conditions. On a personal level, I now understand the critical importance of preparing contingency plans when connectivity cannot be guaranteed, such as downloading necessary materials in advance, maintaining offline working copies of important documents, and structuring my time so that tasks requiring internet access are completed during periods of better connectivity. I also intend to be more attentive to physical wellness during extended work sessions, as the discomfort I experienced in the improvised workspace reminded me that fatigue and physical strain are genuine threats to the quality and consistency of academic output. Beyond personal adjustments, I also hope to communicate these concerns constructively to school administrators and program coordinators, so that future batches of work immersion students may be provided with improved facilities and working conditions. Advocating

for better infrastructure is not merely a matter of comfort. It is an investment in the quality of research that the school is capable of producing.

In many respects, this work immersion has been among the most clarifying and formative experiences of my senior high school education. It confirmed that research is the kind of work I genuinely wish to pursue, not in spite of its demands, but because of them. The ability to organize complex information, evaluate sources with critical discernment, produce coherent and well-structured written outputs, and collaborate effectively under pressure are skills I now know I possess and skills I recognize I must continue to develop with greater intentionality. This immersion has prepared me to make more informed and grounded career decisions by offering me a concrete and unfiltered view of what research work truly entails. It is rigorous, detail-oriented, and often demanding in ways that are not immediately visible from the outside, and I found that I was genuinely drawn to it for precisely those reasons. I leave this experience with a clearer sense of purpose, a deeper appreciation for the discipline that research requires, and a more defined vision of the kind of professional I am committed to becoming.
